## Heifer Development for the Cow/Calf Producer & Stocker Operator

Tri-State Beef Conference Abingdon, VA August 8-9<sup>th</sup>, 2013

> Justin Rhinehart Beef Cattle Specialist

INSTITUTE of AGRICULTURE

**Animal Science** 

### Justification

- Developmental period
  - -Period from weaning to first calving
  - -Influences lifetime productivity and longevity
- Properly developed heifers:
  - -Calve early in the first calving season
  - -Calve early in subsequent calving seasons
  - -Wean heavier calves
  - -Remain in the cow herd longer

## Objectives

- Breed early in the first breeding season
- Minimize calving difficulties
- Wean acceptable calves
- Breed early in the second breeding season
- Minimize overall cost
- Optimize profit
- Improve genetics

## Decide on Business Model

#### Decide

- Stocker Operator
  Steers, Heifers or Cows
  - -Owned or Contract

- Cow/Calf Producer
  - -Retained or Purchased
  - Custom or Home Development

#### How much does a replacement cost?

|                               | Retained | Purchased |
|-------------------------------|----------|-----------|
| Deferred Revenue*             | \$1,050  |           |
| Development <sup>†</sup>      | \$450    |           |
| Opportunity Cost <sup>‡</sup> | \$270    |           |
| Purchase Price <sup>∆</sup>   |          | \$1,800   |
| Total                         | \$1,770  | \$1,800   |

\* 700 pound heifer at \$150/cwt.

<sup>+</sup> Includes nutrition, breeding, labor and death loss.

<sup>\*</sup> Revenue lost from running three fewer cows with the recourses that used to develop five heifers.

<sup>A</sup> Estimated average purchase price for heavy-bread, superior genetic replacements in 2012

## Do It

#### •At weaning or purchase

- -Select oldest and heaviest heifers
  - Consider frame score and mature cow size
- -Select more than you need as replacements
- -Set target weight = 67% of mature cow weight
- -Set breeding date

- Decide on growth pattern
- Develop ration(s) to gain appropriate weight
- Weigh heifers to ensure weight gain is on target
- •Use body condition scoring (BCS)

#### **Growth Pattern**

**Days Post-Weaning** 

#### New Concepts in Nutritional Development

- Genetic improvement has advanced the age at puberty
  - The 60% target weight might now be out of date
  - Can reduce input cost of purchased feed
- Intensive management systems might maximize pregnancy rates but do not optimize profitability

One month before breeding season
 Perform pelvic area measurements
 Cull heifers with unacceptable pelvic area
 What is an unacceptable pelvic area?

- One month before breeding season
  - -Reproductive tract scores (RTS)
  - -Cull heifers that are
    - sexually immature

•1 month before breeding season

-Vaccinate against Vibrio, Lepto, and respiratory/reproductive disease complex (IBR, BVD, etc.).

-Develop synchronization system (use some type of progestagen)

#### • Post – breeding

- -Pregnancy check
- -Cull open and late-bred heifers until

replacement number is reached

#### • Post – breeding

- -Heifers should weigh approximately 85 to 90% of mature weight at calving
  - Usually results in 1 lbs./day until calving
  - Maintain BCS of 6
- -More critical analysis of selection traits
- -Give special attention during calving
- -Maintain BCS 5 until re-breeding

# Scenarios

#### **Custom Developer**

#### **Stocker Operation**

#### **Diversified Stocker**

#### **New Producer Entry**

#### Take-Home Message

- Developing heifers is the "make or break" period for their value as cows.
- There is a tremendous expense associated with developing heifers.
- In all cases, pregnancy check early!!
- Consider diversification and non-traditional methods (both management and business models).
