The cow-calf budget was developed to assist Tennessee cattle producers in estimating the cost of production and net return to land and management. This budget should be considered a template or guide to estimating expenses and revenues, and it should not be considered representative of all circumstances. Users of this budget are encouraged to enter information into the budget that reflects their individual situation and production practices. Using information most closely related to a particular operation will improve the decision-making process.

Disclaimer: Significant variability in inputs, prices and production practices exist across operations and from region to region. The information contained in this spreadsheet relies on estimates and assumptions specific to Tennessee. This budget should not be construed as a reflection of all circumstances across the state, as regional variability does exist. To improve the value of this tool, users are encouraged to use inputs, prices, production practices and management that are employed on their specific operation.

Footnotes:

¹Cull cow revenue (\$/cow) = (weight X price X number of cows sold) / total number of cows

$$\$192.00 = (1200 \text{ lbs} \times \$1.00/\text{lb} \times 8 \text{ cows sold}) / 50 \text{ cows}$$

The same method is used to calculate heifer and steer calf revenue on a \$/cow basis.

²Accounts for bull pasture and hay costs on a yearly basis. Assumes costs are 1.7 times higher than a cow.

³If artificial insemination is utilized, then users of this budget are encouraged to evaluate the number of breeding bulls.

⁴Accounts for annual depreciation and interest on purchased breeding stock (cows and bulls).

⁵Miscellaneous overhead is assumed to be 10% of total overhead costs to account for unforeseen costs associated with overhead.
